RECORDING WORKFLOW

🎥 Recording Workflow

Workflow Overview

1. **Task Plan** Develop a clear, realistic task that uses your existing domain skills and judgment, then propose it in Studio. Your idea needs to be approved.
2. **Prepare** Once your idea for your task is approved, it moves to **In Progress**; continue in that same task. Your full approval text is pre-filled into the Prompt/Description field; complete the required Studio fields, and prepare your Metadata.rtf, files, apps, and recording environment.
3. **Record and Validate** Record and narrate the complete task from beginning to end. Review the recording and required files for quality and compliance.
4. **Upload and Submit** Verify the required TaskRecorder and deliverable files, then upload them to Studio. Complete the remaining Studio fields and submit the task.

RECORDING WORKFLOW

👨‍💻 Technical Setup

MacOS Technical Setup

MacOS Requirement

Complete the following setup before recording your first task. These requirements are not preferences or recommendations; they are **technical requirements** of the data collection application. Apple silicon (M-series) and Intel Macs running macOS 15 or newer are supported. Use TaskRecorder2.4.4.dmg on Apple silicon and TaskRecorder2.4.4-Intel.dmg on Intel.

Hardware Expectations

- **Processor: Apple M-series (Apple silicon) or Intel Mac (Intel uses TaskRecorder2.4.4-Intel.dmg)**
- **macOS:** Version 15 or newer
- **Memory (RAM):** 16 GB preferred
  - 8 GB RAM technically works, but sometimes struggles with TaskRecorder
  - 24 GB or more may be needed for visually demanding tasks
- **Display:** Built-in laptop display preferred
  - Avoid recording at native 4K/5K resolution. Resolution, graphic complexity, open apps, and motion can affect safe recording length.
- **Disk Space:** 35 GB of free disk space for a 20-minute task
  - More space is required for longer or graphic-heavy recordings, as TR requires a lot of disk space
- **Connectivity:** Stable, high-speed internet connection is required for uploading the large recording files

Software & Licensing Expectations

Some tasks involve **specialized software** (for example: CAD tools, creative software, developer tools).

- Try to sign into apps with your mercor.expert email to avoid any PII exposure
- Use only licenses that allow commercial use.
- You may use your own licensed copy if you activate it before recording and no name, email or license detail appears in the recording.
- For paid apps, we reimburse up to $50 USD per writer per rolling 30 days, across all apps, taxes included. No exceptions on eligibility or cap. For more information or to file a claim, please see the App Reimbursement Claim Form. Further terms:
  - Purchase/claim timing: ordinary eligible purchases need no pre-purchase sign-off. Claim with the receipt once a complete task meaningfully using the app is submitted; that task does not need to be approved first.
  - Annual/lifetime plans and bundles require separate approval, still count toward the cap.

- Writer must already have at least one completed, approved task. Purchases made before policy announcement are ineligible.

Set up your Desktop

Your recording captures your screen, your narration, and click behavior. The goal of this section is to (a) ensure the data is captured and (b) make sure no personally identifiable information makes it into the recording.

You can record from your everyday Mac account. Do Part A once; run through Part B before every recording.

Prefer a completely separate account? Allowed but not recommended — it makes setup a bit longer. See Create a Recorder Mac User in the Appendix.

Part A — One-time setup (about 10 minutes)

A1. Clear your Desktop

Your task will be sent back if other items and windows are visible during the recording.

Don't delete anything. Move it out of sight: everything stays on your Mac and comes back with a drag.

- Click your Desktop, press ⌘ + A to select everything, then Control-click the selection and choose New Folder with Selection. Name the folder Desktop items.
- Drag the Desktop items folder into your Documents folder so your Desktop is empty.
- Control-click each widget on your Desktop and choose Remove Widget — especially Calendar, Contacts, Photos, Find My, and Weather.

A2. Use a built-in wallpaper

System Settings → Wallpaper → pick any Apple wallpaper. No personal photos.

A3. Set up Do Not Disturb

Your task will be sent back if interrupted by dings and reminders and texts.

Set the: Do Not Disturb silences Messages, Mail, Calendar, Slack, and anything relayed from your iPhone. Check these settings once:

- Open System Settings → Focus → Do Not Disturb.
- Under Allowed Notifications, set People to None and Apps to None.
- Turn Intelligent Breakthrough & Silencing off (on older macOS this is Time Sensitive Notifications). It lets some notifications break through Do Not Disturb.

A4. Use a fresh browser

On a personal account, the browser is where PII most often leaks: address-bar suggestions, saved addresses and cards, the bookmarks bar, your Google avatar.

Install Mozilla Firefox or use a fresh Chrome or Safari profile, and use it only for tasking. A fresh browser has none of your history, saved addresses, or bookmarks.

On first launch, choose Skip if the browser offers to import from another browser, and don't sign in to a browser account.

A5. Rename your Mac

This is for confidentiality. Your task will be sent back if we see any private information at all.

By default your Mac is named after you ("Jane's MacBook Pro"), and that name appears in the Finder sidebar, in every Open and Save dialog, and in Terminal.

- System Settings → General → About → click the Name field and change it to something neutral, like Mac.
- System Settings → General → Sharing → under Local hostname, click Edit and set

it to match.

ℹ️ One thing you can't hide: your macOS username appears in Save/Open dialogs and file paths. If it's your real name, keep those dialogs brief — or use the separate Recorder account, which is the only way to avoid it entirely.

A6. Run a 10-second test recording

Start a short recording, switch between two task apps, open a Save dialog, stop. Watch it back and look for your name, email addresses, personal filenames, or notifications. Fix anything you see before your first real task.

Part B — Before every recording (1 minute)

- Turn on Do Not Disturb — Control Center → Focus → Do Not Disturb.
- Quit every app you don't need with ⌘ + Q (the red button only closes the window). Press ⌘ + Tab — only your task apps and the recorder should appear.
- Don't click the Downloads stack in the Dock during a recording — it previews your recent downloads. Open Finder → Downloads instead.
- Quit all project material — Studio, Slack, the Writer Guidelines. Nothing on screen should say Mercor or Odin.
- Opening document shows only your Goal text — never the Approval ID.

After you finish recording

Turn Do Not Disturb off. If you want your Desktop files back, drag them out of the Desktop items folder.

Download & Install Xcode

The Accessibility Inspector is accessed through Xcode and must remain running throughout every recording. Xcode itself may be closed.

1. Search and install **Xcode** from the App Store.

If you have macOS 26.6 or lower:

1. First, determine which version of Xcode you need, based on your macOS version, by checking here.
2. Navigate to the Apple Developer More Downloads page.
3. Sign in with your Apple ID.
4. Accept the Apple Developer Agreement and decide whether you would like to receive communications from Apple.
5. Select “I’m not interested” when asked to “Customize your experience with Apple Developer”

Download & Install TaskRecorder

1. Download TaskRecorder2.4.4.dmg from Important Links. TaskRecorder2.4.3.dmg and earlier packages are obsolete. A browser-added duplicate suffix such as (1) does not change the version.
2. Open the downloaded DMG. (Using a separate Recorder account? See the Appendix for where to put the installer first.)
3. Quit every running TaskRecorder copy (⌘Q) and eject older TaskRecorder disk images (DMGs). After installing the current app, remove obsolete app copies and old DMGs so you do not reopen them. Keep all recordings and exports.
4. Drag TaskRecorder into **Applications**, *select **Replace** if prompted.*

Required Mac Settings

Change Required UI Elements

1. Keep the system language set to English.
2. **Configure the clock to display seconds:** Go to **System Settings** > **Menu Bar** > **Clock Options** > toggle **Display the time with seconds** on
3. Set dock at left/right: Go to **System Settings** > **Desktop & Dock** > **Bottom** dropdown > select **Left/Right > Make sure 'Automatically hide and show the dock' is off > Show indicators for open applications is on**
4. Change at least one UI element per recording; more is better: wallpaper, light or dark mode, accent color, Dock size, sidebar icon size, screen resolution, or an in-app theme.

Studio, Slack, the Writer Guidelines, and other project material should be quit before you start a recording (see Part B).

Set up and Log into Workpuls/Insightful

1. Follow Step 2: Sign in to log into Insightful.
2. For hourly-paid work, select Odin in Insightful and press **play** to track active work. Do not run the timer for eligible tasks retaining old per-task terms (Pay FAQ Q9).

For Insightful setup or tracking issues, tag Maven in #odin--helpdesk. Pause hourly-paid work if tracking stops or your approved hours run out.

Set up Accessibility Inspector

1. Open **Xcode** from Applications and go through the initial Xcode setup until you see the view below.
2. In the dock, right-click on Xcode > **Open Developer Tool** > **Accessibility Inspector**
3. After Accessibility Inspector is opened, click the **red X** in the upper-right corner to close the Accessibility Inspector window using the red button.
4. Do not minimize or fully quit the application.
5. Confirm that the blue magnifying-glass icon remains in the dock with a **dot** underneath it.

Set up TaskRecorder

1. Open TaskRecorder from the Applications folder.
2. If macOS says Apple could not verify the developer or check the app for malicious software, and you downloaded the official package above, select Done, then go to System Settings > Privacy & Security > Open Anyway and confirm. If the warning says the app is damaged, contains malware or will damage your computer, do not bypass it; share the exact warning in #odin--helpdesk.
3. Authenticate and confirm that you want to open the application.

See Technical Issues if TaskRecorder does not open normally.

Grant Permissions and Open TaskRecorder

1. Grant TaskRecorder access to:
2. Accessibility
3. Screen Recording
4. Microphone
5. Confirm that all three permissions show green check marks in TaskRecorder.
6. TaskRecorder 2.4.4 does not require OTA or Google sign-in. If you have an older version, please use the latest version.

7. Identify the downloaded package by TaskRecorder2.4.4.dmg. Run a short test recording and check video, narration audio and screenshots before starting a task.

See Technical Issues if TaskRecorder still asks for sign-in after updating. If the updated app freezes before displaying a window after the installation and Open Anyway steps, report a launch failure in #odin--helpdesk with your Mac chip, macOS version, exact behavior and a redacted screenshot. A launch freeze is separate from a Google-account password error. Do not disable macOS security protections or run commands from unverified sources.

Appendix

(optional) Create a Recorder Mac User

Use a separate macOS account for all project recordings. This prevents personal information, accounts, notifications, and unrelated project content from appearing in your recording.

1. Open **System Settings.**
2. Go to **Users & Groups**.
3. Click **Add User**.
4. Create an **Administrator** user and use a neutral account name such as ***Recorder***. *Do not use a real name.*

If you use a separate Recorder account, also do the following:

1. Sign out of your personal account and sign in to the Recorder account. Complete the initial setup without connecting an iCloud account.
2. Download the TaskRecorder installer on your regular account and move its DMG to /Users/Shared. Then, in the Recorder account, open /Users/Shared and install it from there.
3. Do the Part A steps (wallpaper, Do Not Disturb, fresh browser, Mac name) in the Recorder account. Its Desktop will already be empty.
4. Keep Studio, Slack, the Writer Guidelines, and other project material in your regular account.

RECORDING WORKFLOW

💡 Task Ideation

Task Ideation

A strong task reflects realistic professional work, demonstrates meaningful expertise and judgment, and produces a clear final deliverable.

IMPORTANT: Plan for a recording, including the short intro and epilogue, that is at least 15 minutes and no more than 50:59 minutes (15:00-50:59). The workflow should feel natural, be mostly mouse-driven, and use real task apps.

IMPORTANT: Every task **Idea** must be submitted and approved in the Studio first. Once your Idea for your task is approved, the same Studio task you proposed it in moves to In Progress. Continue in that task; do not create a duplicate or wait for a new task.

Brainstorming Stage

Step 1. Define the Professional Context

Start by identifying:

- Your professional role
- The purpose of the task
- The intended user, client, or stakeholder

The scenario should be realistic for someone working in your domain of expertise.

Need a task idea? Tag @Maven in #odin--ideation. Keep follow-up questions in the same thread and tag @Maven when you need another answer.

Step 2. Plan Professional Work

Choose realistic work in your domain that uses skills and judgment you already have and produces a clear, useful deliverable.

Examples include:

🎨 **Healthcare / Medicine:** Review de-identified patient education materials, compare them with clinic guidance, and create an updated handout.

📊 **Engineering / Data:** Clean and compare a permitted dataset, create clear charts, and prepare a short findings report for a stakeholder.

🏙️**Architecture:** Update a room layout from a client brief, check the dimensions and circulation, and export a labeled plan for review.

🛤️**Note:** There is no minimum task complexity. Choose realistic professional work in your domain.

🛤️

Step 3. Select Your Apps

Use genuine task apps that materially contribute to the workflow. Unrestricted apps may be used without prior approval; an app does not need to appear in an approved-app catalog. Follow the current banned-app, limited-use and app-specific rules in App Eligibility and Limited Use.

- Use only apps with a license that **allows commercial use**. If you are using a trial or free version, please check that it allows commercial use.
- One app is the bare minimum, so a single-app task is allowed, but aim for 2-3 apps that each do real work in the workflow.
  - Using multiple apps is encouraged when each contributes meaningfully to the workflow.
- Repeated use of the same app still counts as one app
- A supporting app counts only when it contributes meaningfully to the task or final output
  - **Example: Clockify**
    - Only starting and stopping a timer → **does not count**
    - Manage relevant client, project, and task records, assign tracked time or billing details, and generate or export a report or invoice that contributes to the task results → **does count**
- The opening Task Description(Goal) document app does not count unless it is used again for substantive task work
- Insightful never counts as a task app
- **DO NOT** use restricted apps
- For paid apps, we reimburse up to $50 USD per writer per rolling 30 days. See Software and Licensing Expectations subsection for more information.

`Vary your app choices across submissions when possible.`

Step 4. Prepare Appropriate Input (if applicable)

Identify any files, datasets, templates, and source materials you may need for the task. Input files are not a requirement for tasking.

Websites you only visit for research or context during the task (e.g., reading documentation, looking up reference data) are not input files. They don't need to be in Deliverables.zip or listed in Final Notes. An input file is a file you prepare before recording and open or use in the task.

Inputs must:

- Contain no private or non-public personal information
- Be self-created, synthetic, or AI-generated before recording
- Contain no visible watermarks (a Gemini watermark is the one exception) or copyrighted materials
- Be available before the recording begins

Do not use paywalled, watermarked, copyrighted, Unsplash, or unclear-rights content. Verify the original source and license.

Note: AI may be used to prepare inputs before recording (only Gemini is permitted), but no AI interaction or branding may appear during the recording (a Gemini watermark on a prepared input is allowed).

In Studio Final Notes:

- For AI-generated inputs: Enter AI-generated before recording
- For non-AI inputs: Provide the original source URL if applicable.

Step 5. Define the Final Deliverables

Every task must produce at least one clear, useful final output.

Before recording, identify:

- What you will create
- Who will use it
- What format it will use
- How you will verify its accuracy, quality, or completeness

The recording should show the complete process that leads to the final deliverable.

Metadata.rtf Drafting Stage

Download the provided Metadata.rtf template, and complete the three sections:

1. **Topology:** List every app visit in chronological order, repeating an app each time you return to it. Use only LOOKUP, CREATE, or MODIFY to identify the action for each visit to each app.
2. **Request:** Paste the same Goal text you entered in TaskRecorder. It must match TaskRecorder exactly.
3. **Task Description:** Write a numbered, high-level outline of the main task steps, naming the apps, key methods, and final deliverable. The steps should reflect the workflow in Studio and TaskRecorder.

- Propose your task idea in the Mercor Studio and get it approved before recording.

- See the Golden Example page for complete Task Description/Metadata.rtf/Recording examples.

Ready to start?
Create a task in Odin Production Full Workflow.

RECORDING WORKFLOW

Studio Workflow

Step-by-Step Studio Workflow

Complete the Technical Setup page instructions before following the Studio workflow below.

Part 1. Start in Studio

Studio is the main platform for Project Odin task workflows. Let's get started by getting logged in, and finding key information, and navigating to the correct "World".

1. Go to **Okta** (https://c-mercor.okta.com/) and sign in with the personal email linked to your Mercor account.

Do not use a VPN - Okta blocks sign-ins through a VPN, proxy, or other anonymizing network and shows a 403 Access Forbidden error before the sign-in page loads. Turn off any VPN (system-wide app or browser extension) before starting the Okta setup and whenever you sign in to Okta. See the Account Security and Conduct policy.

1. Click the Studio tile in Okta My Apps to open Studio.
2. Within Studio, you can navigate to the project guidelines or to your active workstreams using the left sidebar.
3. Navigate to Tasks from the left sidebar.
4. Within Tasks, navigate to the World **Odin Production Full Workflow** if you need to**.**

Part 2. Create your Idea

Now that we are logged in to Studio, we can get to work! We will first propose a task for submission. The review team will check this for novelty and compliance before you progress to actually recording a workflow. Your idea must be approved before you record.

1. Create a new task with the button **+ Create Task**
2. In studio, the process should be fairly easy to follow step by step

Watch this video, we update it regularly.

1. Open section **1. Create your idea**. If the section is collapsed, click its title to expand it.
2. Fill in **Describe your idea.** The box is pre-filled with five headings. Write you answer after each heading and replace nothing else:
3. **Domain / Role:** The field this task comes from, and who would do it (e.g., financial analyst, music producer).
4. **Goal**: The desired outcome of someone executing this task, and who will use the resulting work product.
5. **Starting materials**: Say whether you are starting from scratch or using existing material. Where existing material is being used, describe it: files, data, or a project you already have on hand before beginning recording.
6. **Steps (with the apps for each)**: A rough outline of how you will do the work, showing your professional judgment. Name the app you use for each step.
7. **Deliverable**: What will be produced by the work conducted, and how a reviewer can check that it is complete. This refers to the work product being recorded, not

can check that it's complete. This refers to the work product being recorded, not the recording itself.

8. Fill in **Apps**: **Choose the app or apps you will use. One app is the bare minimum, so a single-app task is allowed, but aim for 2-3 apps that each do real work in the workflow. Multiple apps are encouraged when each contributes meaningfully to the workflow.** Unrestricted apps do not need prior approval or an approved-catalog entry. Follow the current App Eligibility and Limited Use rules rather than legacy labels in screenshots or the dropdown. Banned apps remain prohibited and limited-use conditions still apply.
9. **Submit Idea:** The task will be passed to the review team, who will check your work and either return it to you for edits or approve the task.

Key Points:

- Keep Ideas Current: One approved idea = one Studio task
- Never reuse an Approval ID. A pending change request does not replace your current approval; always use the newest approved revision.
- If your plan changes materially, submit a change request and wait for approval before recording.
- Wrote your idea before Oct 19? Your earlier answers appear read-only in Your original idea (written before Oct 19). You can't edit them there. Copy anything you still want into **Describe your idea**; reviewers and the automated checks use Describe your idea and Apps.

Idea Examples

➡

Domain / Role: Chemical engineer, process safety

Goal: As a chemical engineer, investigate an uncontrolled exothermic temperature spike during an industrial polymer curing cycle. DBeaver will query a local SQLite reactor database, aggregating thermal sensor logs to extract the precise timeline of the thermal runaway. Visual Studio Code will be used to modify the reactor's Python control script, lowering the catalyst injection thresholds to prevent future thermal breaches. Mimestream will draft and format an urgent process-safety notification, attaching the SQL temperature logs and updated script, dispatched directly to the plant operations manager.

Starting materials: Starting from scratch

Steps (with the apps for each):

- DBeaver: query a local SQLite reactor database and aggregate the thermal sensor logs to extract the precise timeline of the thermal runaway.
- Visual Studio Code: modify the reactor's Python control script, lowering the catalyst injection thresholds to prevent future thermal breaches.
- Mimestream: draft and format an urgent process-safety notification, attaching the SQL temperature logs and updated script.

Deliverables:

- A finalized chemical safety audit containing the DBeaver thermal anomaly dataset (exothermic_spike_timeline.csv)
- The corrected VS Code automation script (catalyst_injection_controller.py)
- The dispatched Mimestream safety alert (operations_manager_warning_sent.eml)

➡

Domain / Role: Data analyst supporting a facility engineer

Goal: I am a data analyst supporting a facility engineer who has to decide whether a harmonic filter installed on a factory feeder is good enough to keep. Using synthetic current waveforms sampled at 10 kHz before and after the filter was installed, I will compute the FFT spectrum of each waveform, measure the amplitudes of the 50 Hz fundamental and its odd harmonics up to the 13th, calculate total harmonic distortion, generate a one-page PDF report with the two spectra, check each harmonic against

its limit in a spreadsheet, and annotate the report with the distortion result and a keep or replace decision. I will build and calibrate a digital signal processing pipeline from scratch on a blank audio track in Audacity. The goal is to generate harmonic test signals, apply multi-notch filter cascades to remove electrical hum, execute Nyquist low-pass filtering to attenuate high-frequency noise, measure Signal-to-Noise Ratio (SNR) and RMS dynamic range in dB, and export spectral frequency renders alongside signal metrics logs.

Starting materials: Using existing material

What is already available?: Two synthetic CSV files of current samples (one second each at 10 kHz, before and after the filter) and a small Python helper module with the FFT and plotting functions. All are AI-generated before recording.

Steps (with the apps for each):

- Jupyter Notebook: compute each waveform's FFT spectrum, harmonic amplitudes and total harmonic distortion.
- Google Sheets: check each harmonic against its limit and record a keep or replace decision.
- Skim: annotate the PDF report with the distortion result and the decision.

Deliverables

- The executed notebook (.ipynb), the harmonic amplitude table (.csv)
- The spreadsheet with the per-harmonic limit check
- The decision downloaded as .xlsx, and the one-page PDF report annotated in Skim

Top Tip: Use your "Goal" for Recording:

Paste only the Goal section into TaskRecorder, the opening document, and the "Request" section in Metadata.rtf. Do not show the Approval ID or the rest of the approval text on screen.

Missing Task? Approval states are saved during account setup. Follow your dashboard's next step or use **Copy Setup Request**. An authorized admin will review existing tasks before new creation.

Part 3. Fill Out and Submit a Task

Step 1. Complete the Pre-Recording Fields

Before recording:

1. Once your idea is approved, the same task you proposed in moves to In Progress. Continue in that task; do not create a new task or wait for another one.
2. Click on your task and go through the checklist before you record.
3. Inputs Used
4. **CC0 or public domain sources from the web:** Provide the Web source URL for the source.
5. **AI-generated file:** Files generated using Gemini. (No other AI models allowed)
6. **Manually created file:** Any file you manually created before the recording.

Step 2. Record the Task and Check Files

Follow the How to Record Step By Step page to complete the task with TaskRecorder.

Step 3. Upload the Verified Files and Submit in Studio

1. On the Studio task page, upload your completed metadata.rtf, .mp4, TaskRecorder zip, & Deliverables.zip.

2. **DO NOT** include Metadata.rtf in Deliverables.zip.
3. Run AutoQC checks
4. You must run both AutoQCs before submitting.
5. **Files & Recording:** Your uploads (video.mp4, Deliverables.zip, Task Recorder zip, Metadata.rtf) and your screen recording
6. **Narration:** Your voiceover
7. Major flags block submission: fix or dispute every Major flag before you submit. Minor flags do not block submission: treat them as advice, and fix them if it is quick or apply the feedback on your next task. A Minor flag still points to a quality rule, and a reviewer can send the task back if the recording genuinely breaks that rule. 1. **Dispute: If a flag is wrong, state why, with a timestamp when useful.** 1. **Fix: If a flag is right, fix the cause. For a file or metadata issue, upload the corrected file and re-run AutoQC; no new recording is needed. Re-record only for a genuine recording problem, and never edit the video.**
8. Manual Checks
9. Manual self-review checklist that you need to go through. Only check a box once you have verified it.
10. Checklist and PII Confirmation
11. Review the **Task Checklist** and confirm your task meets all requirements. In Full Workflow, tick the epilogue checkbox if you included the required epilogue OR your idea was originally approved before October 19, 2026, 6 pm PT (PDT). Pre-cutoff ideas remain exempt, including after later revision or reapproval; ticking the checkbox confirms that exemption. Do not tick it if neither condition is true. This manual checkbox is separate from AutoQC. If an AutoQC finding is wrong, use Dispute and provide a written reason with the task link and relevant timestamps. Do not re-record an exempt task solely to add an epilogue. If submission remains blocked, send the task link and exact error to #odin--helpdesk.
12. Review **PII Guidelines** and confirm your task meets all requirements.
13. Before you submit, open the checklist and PII guidelines links, and double-check.
14. Final Confirmation box
15. Check this box only after every Major AutoQC flag has been fixed or disputed and every manual check has been completed.
16. Add any **Final Notes** that you would like to convey to the Reviewer.
17. Select **Submit** to send the task for review.
18. Select **Revise idea** if you need to update your idea, then re-submit for idea checks and updated idea will get reviewed again as normal.

The task will only Submit after all required fields have been filled out!

*After clicking **Submit for Review**, the Task Status should change to* **Ready for Review**.*

After Submission

Check the statuses your task will go through after submission

⏱️ **Ready for Review / In Review:** the task has been submitted and is waiting for a Reviewer / is actively being reviewed.

📝 **Needs Edits:** the task can be fixed and resubmitted. Required action may include **re-recording, files/metadata, clarification, or a combination**.

✅ **Review Approved:** the task has passed human review. This is distinct from final QC clearance.

🎲 **Awaiting Final QC:** the task has been randomly selected for additional QC and is being held until it passes.

🚚 **Ready for Delivery:** the task has cleared all required checks, including QC if

🚚 **Ready for Delivery:** the task has cleared all required checks, including QC if sampled.

🔁 **RFD - Minor / Under Quality Review:** the task is in a quality re-review. This is not final approval. If it is approved, it moves to Ready for Delivery and you are notified; otherwise it is returned for fixes or archived. Keep working on new tasks while you wait.

⛔ **Rejected:** the task is unusable within its approved scope and cannot be fixed through edits. An invalid task concept is an example.

Track your task status in the **My Tasks** tab of the Dashboard in Studio.

📃Always check the Reviewer and Auditor comments at each status' change to avoid repetitive mistakes.

📃
